Darwin's "applied to the family" hypothesis spawned a number of models that attempted to explain the evolution of altruistic offspring including kin selection, reproductive skew and bet-hedging models. The unspoken assumption central to these models was that offspring were initially created equal; differences in the fertility of adults emerge from transactions such as altruistic "giving," or coercive "taking" Dr. Cassill has developed a maternal investment model that departs from an assumption of offspring equality and instead proceeds with an assumption of offspring inequality.
